

# NCEP Ocean Modeling

Current status and future directions

*Hendrik L. Tolman*  
*Chief, Marine Modeling and Analysis Branch*  
*NOAA / NWS / NCEP / EMC*

*Hendrik.Tolman@NOAA.gov*

Weather time scale ocean modeling only, Dave Behringer will discuss CFS / MOM4.

## History:

- Early 1990's: POM East Coast model:
  - Requirement for SOLAS from OPC.
  - Issues with Gulf Stream Separation.
- Late 1990's short-lived focus on in-house model development (CubOc).
- After that: HYCOM Consortium
  - Coalition of the willing with similar mission/requirements.
  - Major Navy input (NRL, ONR).
  - Several academic partners.
  - 2005 implementation of RTOFS-Atlantic (HYCOM).

## History cont'd:

- 2004/5 NOAA SAB board: create NOAA Ocean Backbone Capability (weather time scales) with:
  - Global and basin responsibility for NCEP.
  - Coastal and regional responsibilities for NOS.
    - ➔ Moving operational models to ops. computers.
  - Coastal and regional private-public partnership with IOOS Regional Associations.
- January 2008 workshop at NCEP to align NCEP plans better with SAB.
  - Focus on RTOFS-Global first (NRL HYCOM)
  - Possible only in close collaboration with NRL.

## Five major efforts:

- Eddy resolving ocean modeling. -----
  - Eddy resolving ocean initialization. -----  
Operational 2005  
Operational 10/25/2011

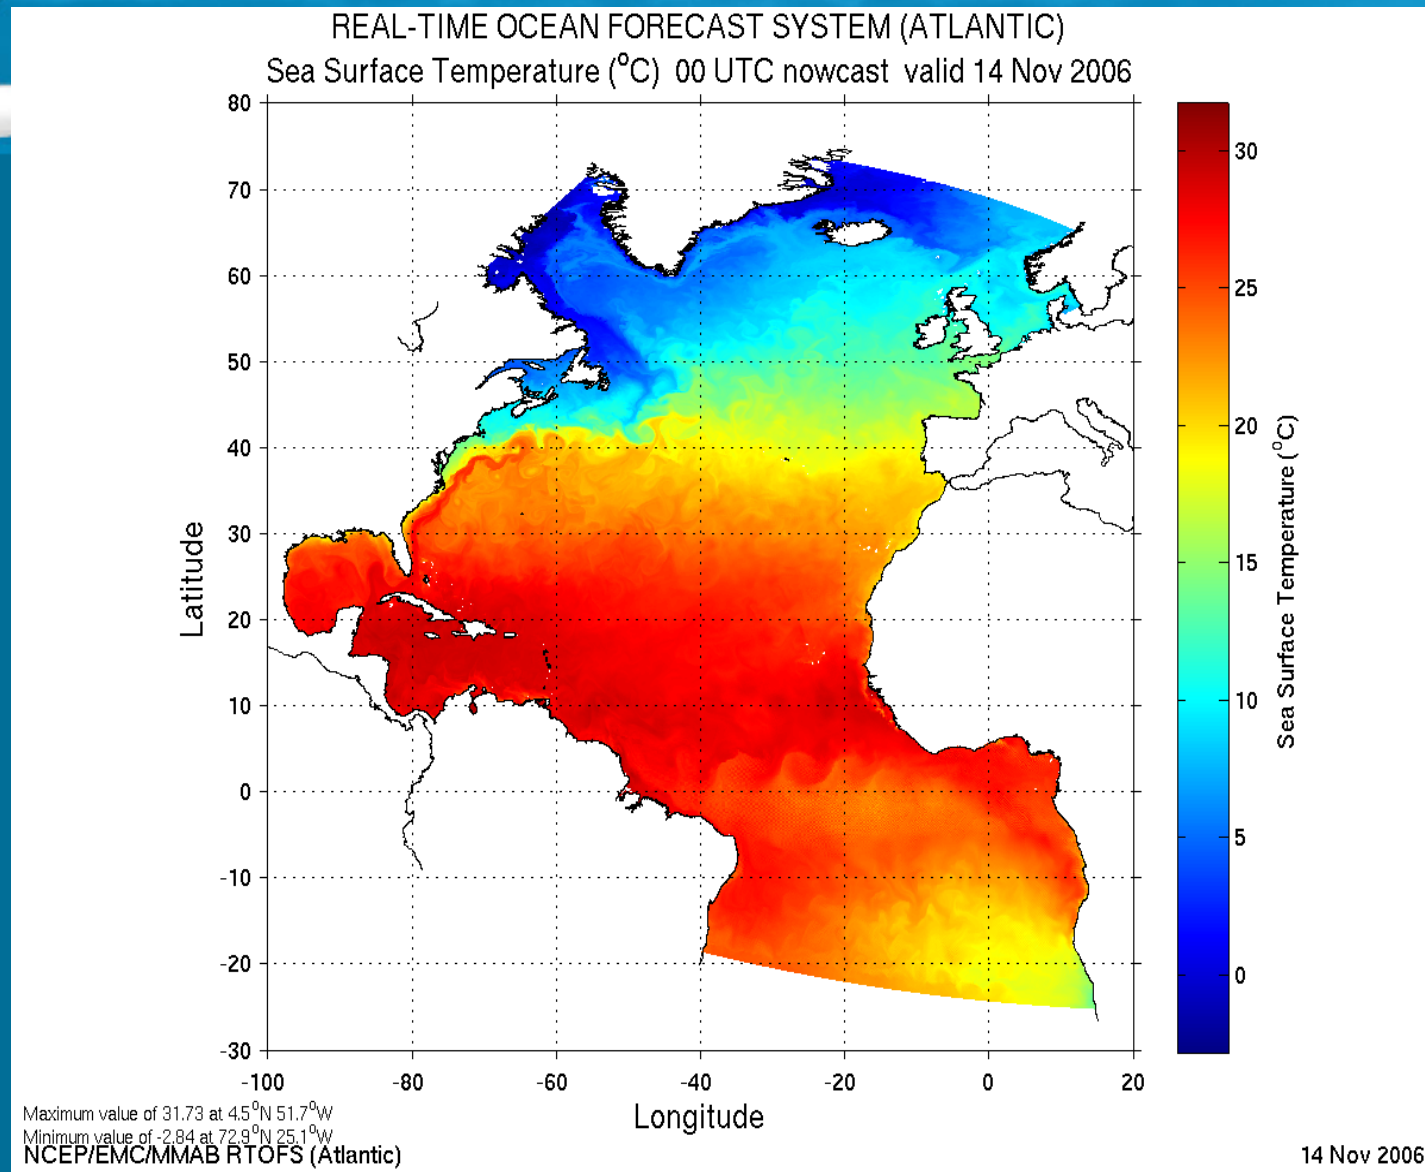

RTOFS-Atlantic  
RTOFS-Global
  - Coupled modeling for hurricanes. nested RTOFS coupled to HWRF  
Live testing
  - Coupled modeling for weather – CFS / NEMS. RTOFS-NEMS  
Under development
  - Episodic tracers (with shelf life) RTOFS-ET-Pac  
Operational 07/24/2012
- 
- All RTOFS models presently based on HYCOM
    - RTOFS represent line of products.
    - HYCOM is underlying ocean model.

## RTOFS-Atlantic

- First full HYCOM model to become operational at NCEP.
- Replacing previous POM model for East Coast (excluding Gulf of Mexico).
- Model with tides, requirement from OPC.
- Issues with model:
  - Left in limbo to get RTOFS-Global in fast.
  - To be nested in RTOFS-Global, boundaries have been headaches.
  - Next decision point: do we keep this model around?
    - ➔ Tides.
    - ➔ 4-6 km coastal resolution for US.

# RTOFS-Atlantic

- Push to global model (vs. regional models):
  - Satisfy requirements from NOAA SAB.
  - Provide boundary data for regional models.
- Adopting existing 1/12° model from NRL (NOPP).
  - GFS forcing (including diurnal cycle).
- Timeline:
  - Operational 10/25/2011 with NRL/NAVOCEANO (NCODA) initialization (daily feed from NAVO).
  - FY2014: full initialization at NCEP.

## paradigm shift for NWS

- NOMADS as main distribution points (OpenDAP, NetCDF).
- RTOFS-Atlantic as testbed for global.
- Linking to NOS Coastal Ocean Modeling Framework.
- No tides yet (unlike RTOFS-Atlantic)

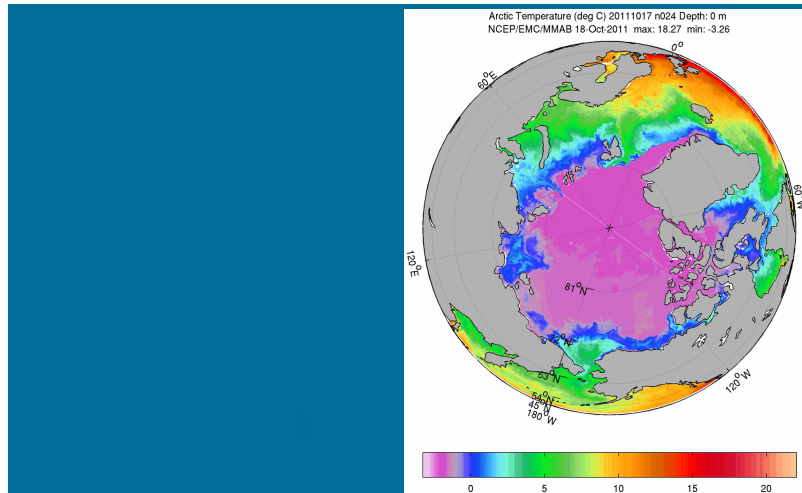

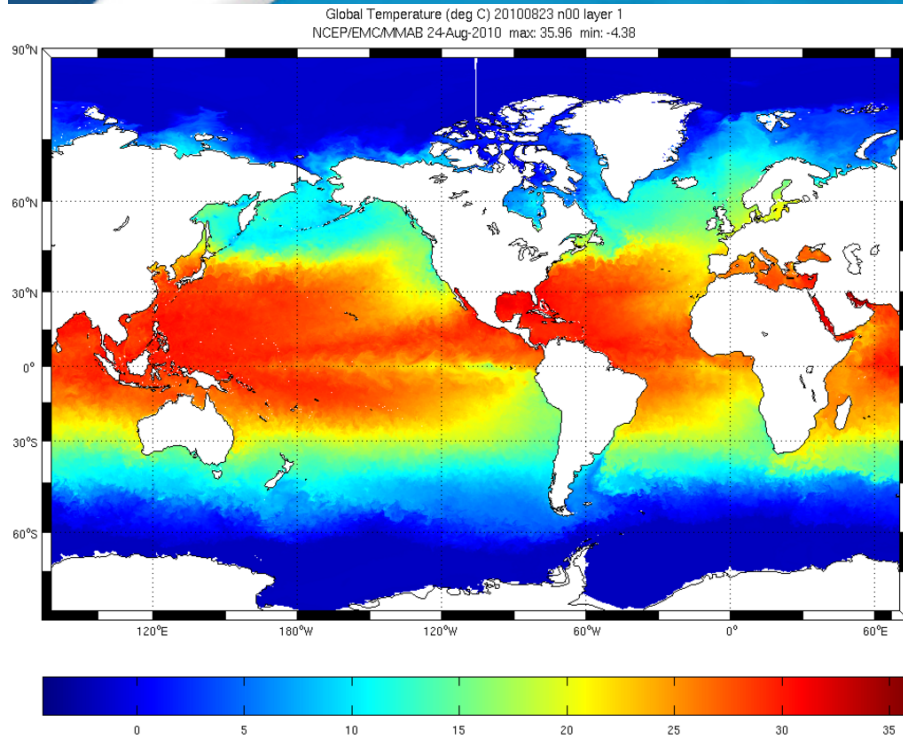

# RTOFS-Global

Grid and layer 1 temperature  
snapshot:

## Focus on producing GODAE metrics products

### Examples follow:

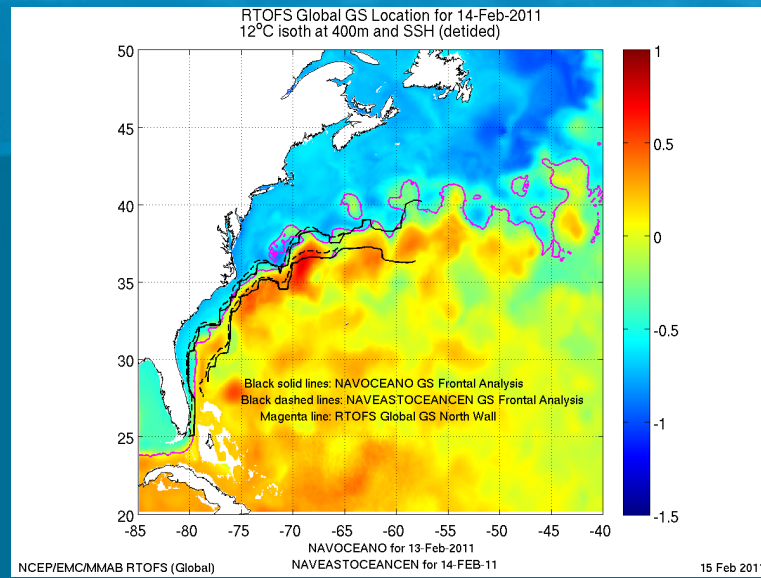

- Class 1: Differences with SSH fields from independent analyses.
- Class 2: Drifts from climatology at selected WOCE sections.
- Class 3: Location of Gulf Stream.
- Class 3: Transports at more than 100 sections.
- Class 4: Statistics on location of Gulf Stream; Daily comparison with independent SST, SSH data.
- Class 4: Comparisons of forecasts/analysis with ARGO profiles.

GFLD-NCEP ocean modeling meeting, 12/27

## Coupled hurricane modeling with regional ocean components

## Simulations and observations for Gustav (2008)

## Lessons learned:

- Coupling to different atmospheric models requires attention to models and or model-dependent flux bias correction.
- Comparison of radiation fluxes below ....

GFS – blue  
HWRF – red

## Intensity Forecast for 6 TCs (186 cases): Gert07L, Irene09L, Katia12L, Maria14L, Ophelia16L, and Philippe17L

HY11=HyHWRF2011; HWRF=operational HWRF

- HyHWRF average intensity error and bias are the best among participant models, except degradation at 12h in average error and negative bias at 24h.
- HyHWRF standard deviation is consistently the smallest, except 12 and 24 h.

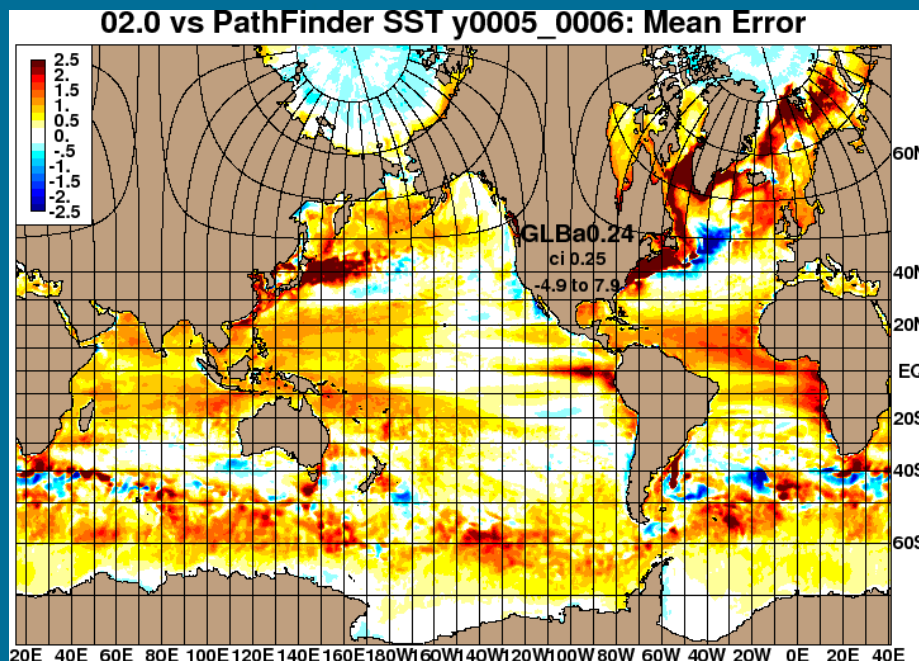

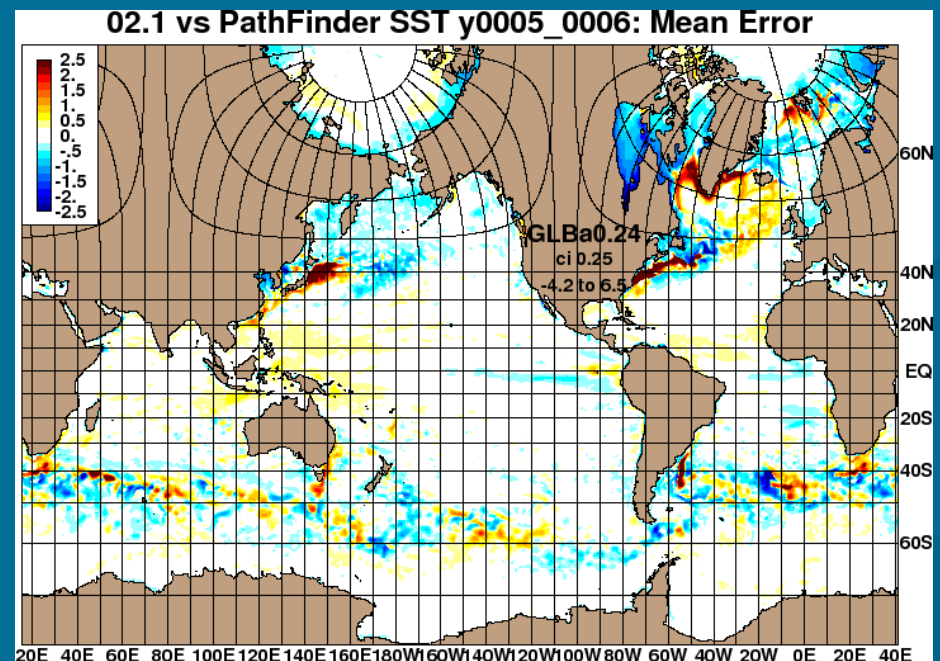

## First step to coupling: manage drifts by flux correction:

- First climatological forcing, then full forcing (CFS  $\approx$  GFS).
- vs. Pathfinder (bias), climatological years 5-6

1<sup>st</sup> climatological simulation

2<sup>nd</sup> climatological simulation, with flux correction

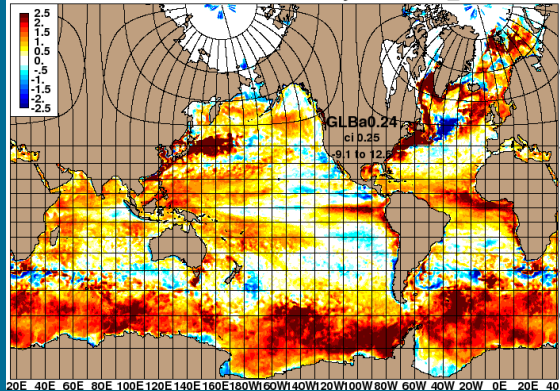

Climatological run, no  
flux correction

Same but with flux  
correction

## EMC became US government lead on ocean plume modeling for Fukushima Dai'ichi ocean contamination.

- Collaboration in large Interagency work group.
- Leveraging modeling from Navy, DTRA, NOS.
  - NCEP Navy model data distribution point.
- CONOPS to rapidly generate actionable information for decision makers.
  - Product 1: Surface particle tracing to identify potentially contaminated areas. (April 6, 180 d)
  - Product 2: Contamination estimates using particle tracing + HYSPLIT atm. Deposits. (April 20, 180 d)
  - Product 3: Full dispersion model as passive decaying tracers, using direct release (NOS) and atm. deposit (NCEP) (RTOFS-ET-Pac, operational)

# Example product #1 Plume density animation for first 54 days after initial release.

Plume density (particles/cell) tracked on  $0.08^\circ$  model grid, seeded every  $0.125^\circ$ , (smoothed)

Date: 11 Mar 2011 00Z

Range rings spacing 100 km centered on reactor site

Represents possible distribution not concentration.

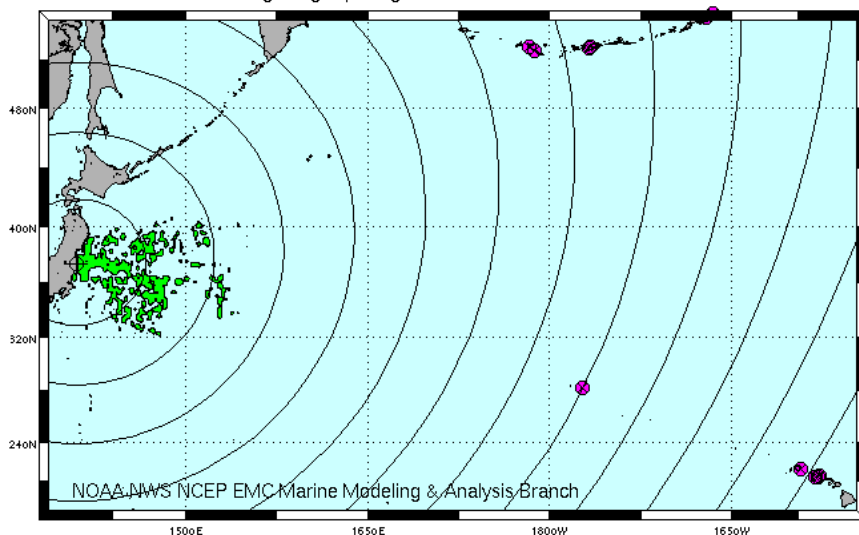

## Example product #2

$^{137}\text{Cs}$  April 1, 2011, 00 UTC

### HYSPLIT-NRC

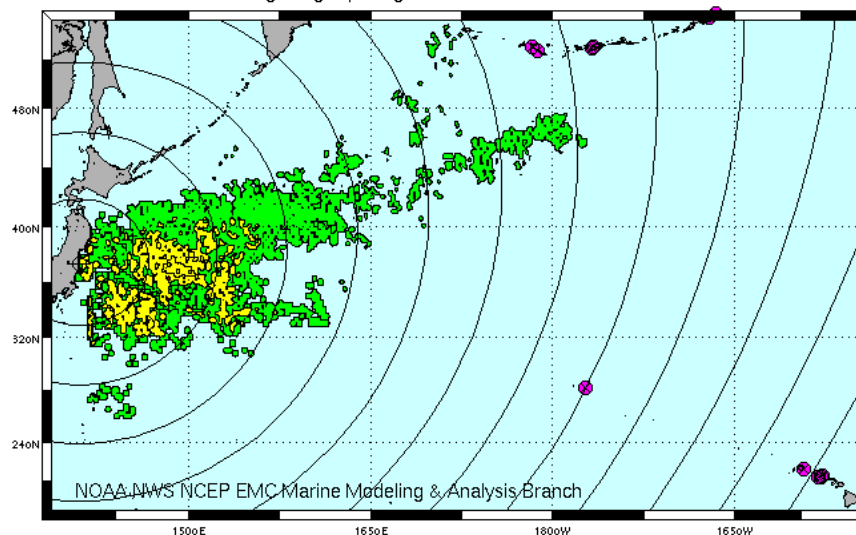

Plume activity for Cs-137 (Bq/l) tracked on  $0.08^\circ$  model grid, seeded every  $0.25^\circ$ , (smoothed)  
 Initialized with HYSPLIT-NRC atmospheric deposition ( $\text{Bq}/\text{m}^2$ ) scaled with HYCOM mixed layer depth  
 Date: 01 Apr 2011 00Z HYSPLIT-NRC data available for 13-27 March  
 Range rings spacing 500 km centered on reactor site

Elapsed Time: 19.00 days Number of particles: 11112  
 Max activity all time ( $\text{Bq}/\text{l}$ ):  $1.45 \cdot 10^0$  Max activity now ( $\text{Bq}/\text{l}$ ):  $1.45 \cdot 10^0$

### HYSPLIT-DOE

Plume activity for Cs-137 (Bq/l) tracked on  $0.08^\circ$  model grid, seeded every  $0.25^\circ$ , (smoothed)  
 Initialized with HYSPLIT-DOE atmospheric deposition ( $\text{Bq}/\text{m}^2$ ) scaled with HYCOM mixed layer depth  
 Date: 01 Apr 2011 00Z HYSPLIT-DOE data available for 15-26 March  
 Range rings spacing 500 km centered on reactor site

Elapsed Time: 17.00 days Number of particles: 8701  
 Max activity all time ( $\text{Bq}/\text{l}$ ):  $2.07 \cdot 10^2$  Max activity now ( $\text{Bq}/\text{l}$ ):  $1.83 \cdot 10^2$

HYSPLIT-NRC and DOE differ by 2-3 orders of magnitude. HYSPLIT-NRC much too low, HYSPLIT-DOE much too high at JAMSTEC line.

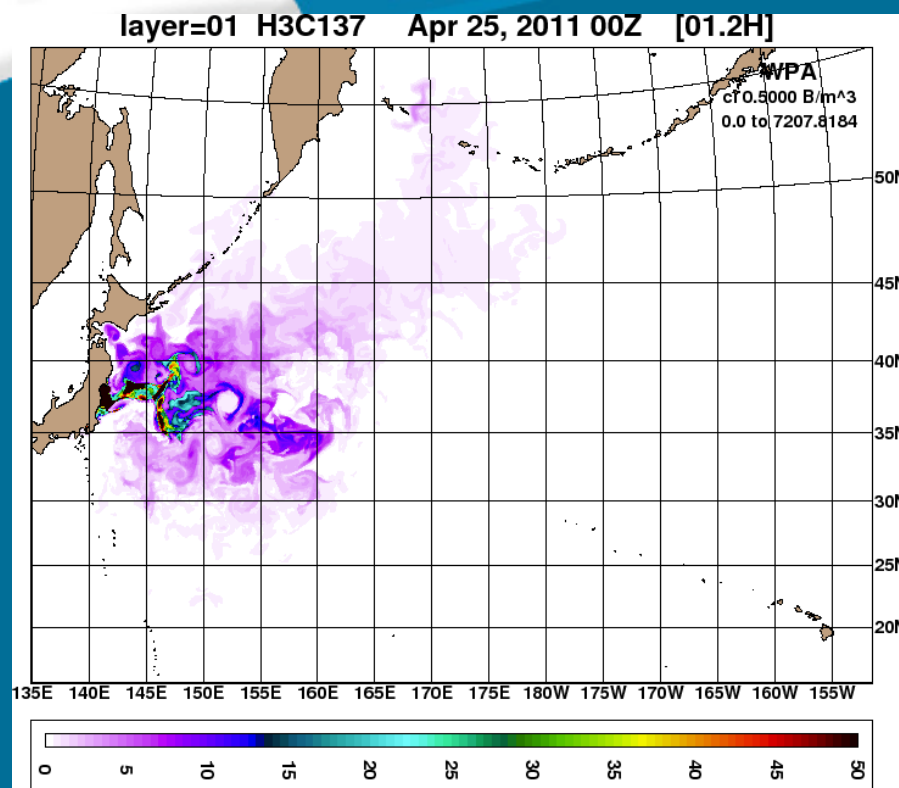

|                   | MCL ( $\text{Bq}/\text{l}$ ) | 1 mrem dose ( $\text{Bq}/\text{l}$ ) |
|-------------------|------------------------------|--------------------------------------|
| $^{137}\text{Cs}$ | 7.4                          | 33                                   |

|                   | MCL (Bq/l) | 1 mrem dose (Bq/l) |
|-------------------|------------|--------------------|
| $^{137}\text{Cs}$ | 7.4        | 33                 |

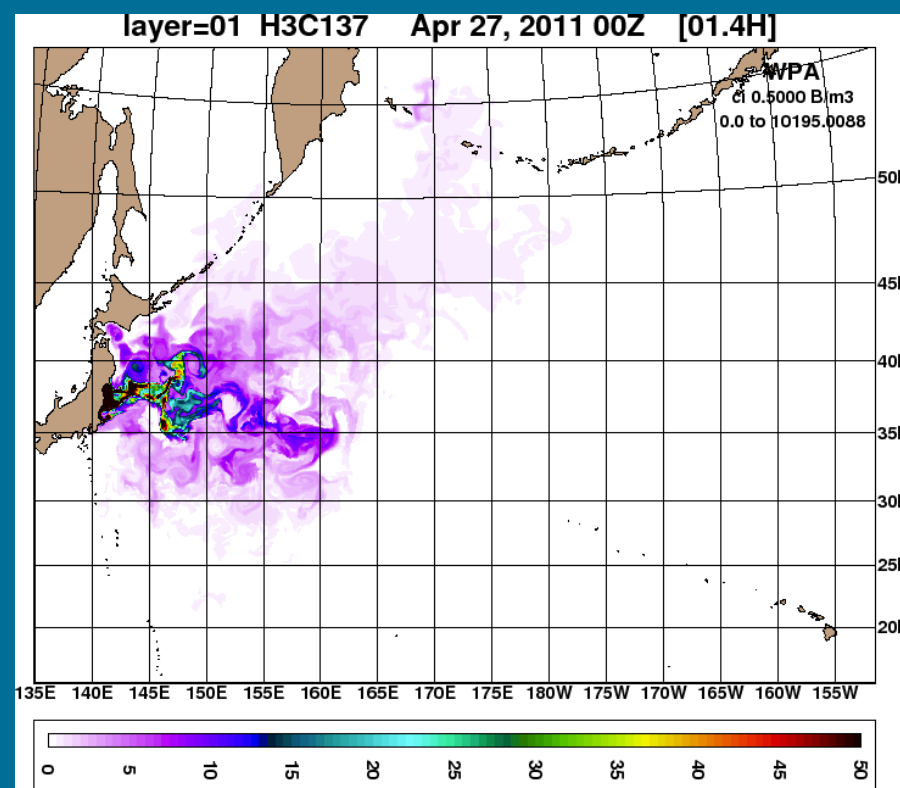

# RTOFS-ET-Pac

$^{137}\text{Cs}$  surface concentration  
(scale max: 0.05 Bq/l or 50 Bq/m<sup>3</sup>)

On April 25, 2011 with wet deposition  
from HYSPLIT data only.  
Max: 7.207 Bq/l or 7207 Bq/m<sup>3</sup>

On April 27, 2011 with added direct  
discharge from ROMS (NOS-CSDL).  
Max. 10.195 Bq/l or 10,195 Bq/m<sup>3</sup>

|                   | MCL (Bq/l) | 1 mrem dose (Bq/l) |
|-------------------|------------|--------------------|
| $^{137}\text{Cs}$ | 7.4        | 33                 |

# RTOFS-ET-Pac

$^{137}\text{Cs}$  surface concentration  
(scale max: 0.05 Bq/l or 50 Bq/m<sup>3</sup>)

On May 30, 2011  
Max: 4,204 Bq/m<sup>3</sup>

On Aug 28, 2011  
Max: 112 Bq/m<sup>3</sup>

On Dec 31, 2011  
Max: 31 Bq/m<sup>3</sup>

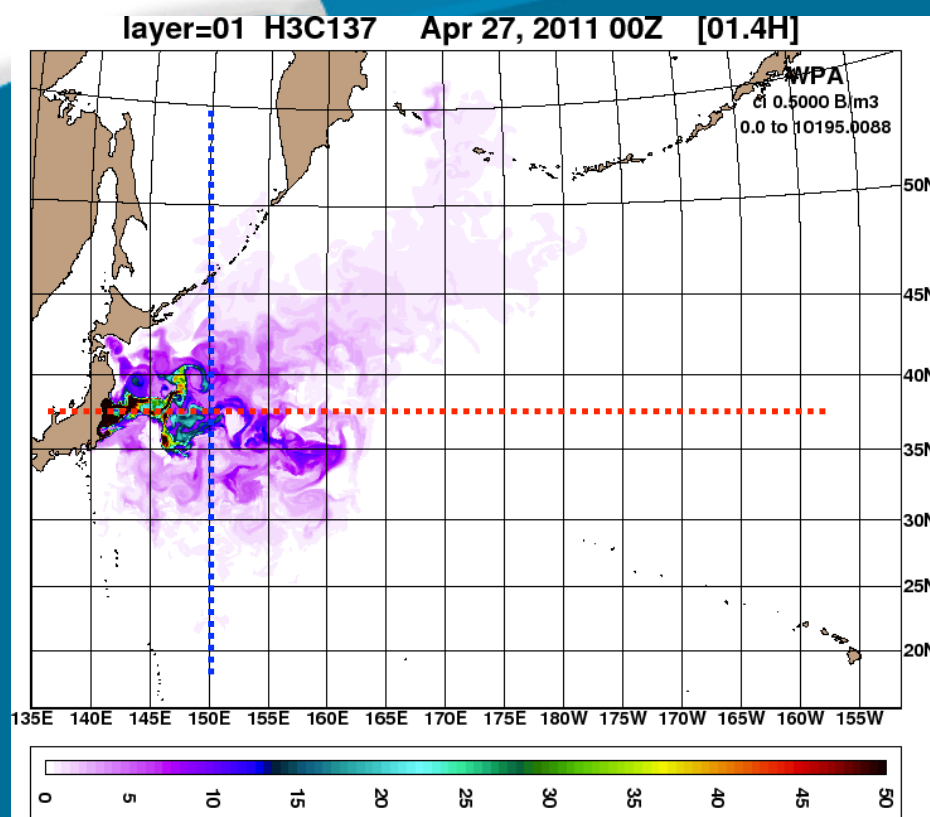

The surface concentrations are diluted as they propagate eastward.  
Note MCL (drinking water) 7,400 Bq/m<sup>3</sup>  
Existing background level approximately 3-5 Bq/m<sup>3</sup> (1990)

|                   | MCL (Bq/l) | 1 mrem dose (Bq/l) |
|-------------------|------------|--------------------|
| $^{137}\text{Cs}$ | 7.4        | 33                 |

# RTOFS-ET-Pac

<http://polar.ncep.noaa.gov/global/tracers>

$^{137}\text{Cs}$  surface concentration

(scale max: 0.05 Bq/l or 50 Bq/m³)

Simulated results after atmospheric (HYSPLIT) and coastal (ROMS) sources were combined (April 27, 2011 ~ December 31, 2011)

- Atlantic:
  - What is future of model ?
- Global:
  - Build capacity: focus on DA with Navy.
- HWRF:
  - Get implemented, architecture of coupling.
- NEMS:
  - Development in ESMF / NEMS environment.
    - ➔ Weather coupling, possible CFS-v3 (MME).
- ET:
  - Develop stand-by capabilities for emergency response.
    - ➔ CONOPS focused, ecosystems modeling link.
- General: coupling wind waves and ice.

**Thank you!**
